- Part 9: Discussion & Conclusions

Lifted Inference on Asymmetric DB

Preprocess Q (omitted from this talk; see [Suciu'11]),
then apply these rules (some have preconditions)

$$P(\neg Q) = 1 - P(Q) \quad \text{negation}$$

$$\begin{aligned} P(Q1 \wedge Q2) &= P(Q1)P(Q2) \\ P(Q1 \vee Q2) &= 1 - (1 - P(Q1))(1 - P(Q2)) \end{aligned}$$

Independent
join / union

$$\begin{aligned} P(\exists z Q) &= 1 - \prod_{A \in \text{Domain}} (1 - P(Q[A/z])) \\ P(\forall z Q) &= \prod_{A \in \text{Domain}} P(Q[A/z]) \end{aligned}$$

Independent project

$$\begin{aligned} P(Q1 \wedge Q2) &= P(Q1) + P(Q2) - P(Q1 \vee Q2) \\ P(Q1 \vee Q2) &= P(Q1) + P(Q2) - P(Q1 \wedge Q2) \end{aligned}$$

Inclusion/
exclusion

Example: Liftable Clause

$$Q = \forall x \forall y S(x,y) \Rightarrow R(y) \quad = \forall y (\exists x S(x,y) \Rightarrow R(y))$$

Example: Liftable Clause

$$Q = \forall x \forall y S(x,y) \Rightarrow R(y) \quad = \forall y (\exists x S(x,y) \Rightarrow R(y))$$

$$P(Q) = \prod_{B \in \text{Domain}} P(\exists x S(x, B) \Rightarrow R(B))$$

Indep. \forall

Example: Liftable Clause

$$Q = \forall x \forall y S(x,y) \Rightarrow R(y) \quad = \forall y (\exists x S(x,y) \Rightarrow R(y))$$

$$P(Q) = \prod_{B \in \text{Domain}} P(\exists x S(x, B) \Rightarrow R(B))$$

Indep. \forall

$$P(Q) = \prod_{B \in \text{Domain}} [1 - P(\exists x S(x, B)) \times (1 - P(R(b)))]$$

Indep. or:
 $P(X \Rightarrow Y) =$
 $= P(\neg X \vee Y)$
 $= P(X) (1 - P(Y))$

Example: Liftable Clause

$$Q = \forall x \forall y S(x,y) \Rightarrow R(y) \quad = \forall y (\exists x S(x,y) \Rightarrow R(y))$$

$$P(Q) = \prod_{B \in \text{Domain}} P(\exists x S(x, B) \Rightarrow R(B)) \quad \text{Indep. } \forall$$

$$P(Q) = \prod_{B \in \text{Domain}} [1 - P(\exists x S(x, B)) \times (1 - P(R(b)))]$$

Indep. or:
 $P(X \Rightarrow Y) =$
 $= P(\neg X \vee Y)$
 $= P(X) (1 - P(Y))$

$$P(Q) = \prod_{B \in \text{Domain}} [1 - (1 - \prod_{A \in \text{Domain}} (1 - P(S(A, B)))) \times (1 - P(R(B)))]$$

Indep. \exists

Example: Liftable Clause

$$Q = \forall x \forall y S(x,y) \Rightarrow R(y) \quad = \forall y (\exists x S(x,y) \Rightarrow R(y))$$

$$P(Q) = \prod_{B \in \text{Domain}} P(\exists x S(x, B) \Rightarrow R(B)) \quad \text{Indep. } \forall$$

$$P(Q) = \prod_{B \in \text{Domain}} [1 - P(\exists x S(x, B)) \times (1 - P(R(b)))]$$

Indep. or:
 $P(X \Rightarrow Y) =$
 $= P(\neg X \vee Y)$
 $= P(X) (1 - P(Y))$

$$P(Q) = \prod_{B \in \text{Domain}} [1 - (1 - \prod_{A \in \text{Domain}} (1 - P(S(A, B)))) \times (1 - P(R(B)))]$$

Indep. \exists

Lookup the probabilities in **D**

Example: Liftable Clause

$$Q = \forall x \forall y S(x,y) \Rightarrow R(y) = \forall y (\exists x S(x,y) \Rightarrow R(y))$$

$$P(Q) = \prod_{B \in \text{Domain}} P(\exists x S(x, B) \Rightarrow R(B)) \quad \text{Indep. } \forall$$

$$P(Q) = \prod_{B \in \text{Domain}} [1 - P(\exists x S(x, B)) \times (1 - P(R(b)))]$$

Indep. or:
 $P(X \Rightarrow Y) =$
 $= P(\neg X \vee Y)$
 $= P(X) (1 - P(Y))$

$$P(Q) = \prod_{B \in \text{Domain}} [1 - (1 - \prod_{A \in \text{Domain}} (1 - P(S(A, B)))) \times (1 - P(R(B)))]$$

Indep. \exists

Lookup the probabilities in **D**

Runtime = $O(n^2)$.

Two Questions

- Question 1: Are the lifted rules complete?
 - We know that they get stuck on some queries
 - Should we add more rules?
- Question 2: Are lifted rules stronger than grounded?
 - Lifted rules can also be grounded
 - Any advantage over grounded inference?

Two Questions

- Question 1: Are the lifted rules complete?
 - We know that they get stuck on some queries
 - Should we add more rules?

Complete for “unate \forall FO” and for “unate \exists FO”

- Question 2: Are lifted rules stronger than grounded?
 - Lifted rules can also be grounded
 - Any advantage over grounded inference?

Two Questions

- Question 1: Are the lifted rules complete?
 - We know that they get stuck on some queries
 - Should we add more rules?

Complete for “unate \forall FO” and for “unate \exists FO”

- Question 2: Are lifted rules stronger than grounded?
 - Lifted rules can also be grounded
 - Any advantage over grounded inference?

Strictly stronger than DPLL-based algorithms

$$\text{FO}^{\text{un}} = \text{Unate FO}$$

An FO sentence is unate if:

- Negations occur only on atoms
- Every relational symbol R either occurs only positively, or only negatively

$\forall \text{FO}^{\text{un}}$ ($\exists \text{FO}^{\text{un}}$) = restrict quantifiers too

$Q = \forall x \forall y (\text{Smoker}(x) \vee \neg \text{Friend}(x,y))$
 $\wedge \forall x \forall y (\neg \text{Friend}(x,y) \vee \text{Drinker}(y))$

Unate

Not unate

$Q = \forall x \forall y (\text{Smoker}(x) \vee \neg \text{Friend}(x,y))$
 $\wedge \forall x \forall y (\text{Friend}(x,y) \vee \neg \text{Drinker}(y))$

1. Are the Lifted Rules Complete?

We use complexity classes

- Inference rules: **PTIME** data complexity
- Some queries: **#P**-hard data complexity

Dichotomy Theorem for $\forall\text{FO}^{\text{un}}$ (or $\exists\text{FO}^{\text{un}}$)

- If lifted rules succeed, then query in **PTIME**
- If lifted rules fail, then query is **#P**-hard

Implies lifted rules are complete for $\forall\text{FO}^{\text{un}}$, $\exists\text{FO}^{\text{un}}$

Will show in two steps: **Small** and **Big Dichotomy Theorem**

NP v.s. #P

Decision Problems:

- SAT = Satisfiability Problem
- SAT is NP-complete [Cook'71]

Counting Problems:

- #SAT = model counting
- #SAT is #P-complete [Valiant'79]

Note: it would be wrong to say “#SAT is NP-complete”

Positive Partitioned 2CNF

A PP2CNF is:

$$F = \bigwedge_{(i,j) \in E} (x_i \vee y_j)$$

where E = the edge set of a bipartite graph

$$F = (x_1 \vee y_1) \wedge (x_2 \vee y_1) \wedge (x_2 \vee y_3) \wedge (x_1 \vee y_3) \wedge (x_2 \vee y_2)$$

E :

Theorem [Provan'83] #PP2CNF is #P-hard

Unliftable Clause

$$H_0 = \forall x \forall y (R(x) \vee S(x, y) \vee T(y))$$

Independent Project

not possible:

For $A_1 \neq A_2$,

$H_0[A_1/x]$ and $H_0[A_2/x]$
are dependent!

Unliftable Clause

$$H_0 = \forall x \forall y (R(x) \vee S(x, y) \vee T(y))$$

Independent Project

not possible:

For $A_1 \neq A_2$,

$H_0[A_1/x]$ and $H_0[A_2/x]$
are dependent!

Theorem. Computing $P_D(H_0)$ is #P-hard in the size of D

[Dalvi&S.2004]

Unliftable Clause

$$H_0 = \forall x \forall y (R(x) \vee S(x, y) \vee T(y))$$

Independent Project

not possible:

For $A_1 \neq A_2$,

$H_0[A_1/x]$ and $H_0[A_2/x]$
are dependent!

Theorem. Computing $P_D(H_0)$ is #P-hard in the size of D

[Dalvi&S.2004]

Proof: PP2CNF: $F = (X_{i1} \vee Y_{j1}) \wedge (X_{i2} \vee Y_{j2}) \wedge \dots$ reduce $\#F$ to computing $P_D(H_0)$

By example:

Unliftable Clause

$$H_0 = \forall x \forall y (R(x) \vee S(x, y) \vee T(y))$$

Independent Project

not possible:

For $A_1 \neq A_2$,

$H_0[A_1/x]$ and $H_0[A_2/x]$
are dependent!

Theorem. Computing $P_D(H_0)$ is #P-hard in the size of D

[Dalvi&S.2004]

Proof: PP2CNF: $F = (X_{i1} \vee Y_{j1}) \wedge (X_{i2} \vee Y_{j2}) \wedge \dots$ reduce $\#F$ to computing $P_D(H_0)$

By example:

$$F = (X_1 \vee Y_1) \wedge (X_1 \vee Y_2) \wedge (X_2 \vee Y_2)$$

Unliftable Clause

$$H_0 = \forall x \forall y (R(x) \vee S(x,y) \vee T(y))$$

Independent Project

not possible:

For $A_1 \neq A_2$,

$H_0[A_1/x]$ and $H_0[A_2/x]$
are dependent!

Theorem. Computing $P_D(H_0)$ is #P-hard in the size of D

[Dalvi&S.2004]

Proof: PP2CNF: $F = (X_{i1} \vee Y_{j1}) \wedge (X_{i2} \vee Y_{j2}) \wedge \dots$ reduce $\#F$ to computing $P_D(H_0)$

By example:

$$F = (X_1 \vee Y_1) \wedge (X_1 \vee Y_2) \wedge (X_2 \vee Y_2)$$

D (tuples not shown have $P=1$)

R	
X	P
x_1	0.5
x_2	0.5

S		
X	Y	P
x_1	y_1	0
x_1	y_2	0
x_2	y_2	0

T	
Y	P
y_1	0.5
y_2	0.5

Unliftable Clause

$$H_0 = \forall x \forall y (R(x) \vee S(x,y) \vee T(y))$$

Independent Project

not possible:

For $A_1 \neq A_2$,

$H_0[A_1/x]$ and $H_0[A_2/x]$
are dependent!

Theorem. Computing $P_D(H_0)$ is #P-hard in the size of D

[Dalvi&S.2004]

Proof: PP2CNF: $F = (X_{i1} \vee Y_{j1}) \wedge (X_{i2} \vee Y_{j2}) \wedge \dots$ reduce $\#F$ to computing $P_D(H_0)$

By example:

$$F = (X_1 \vee Y_1) \wedge (X_1 \vee Y_2) \wedge (X_2 \vee Y_2)$$

$P_D(H_0) = P(F)$; hence $P_D(H_0)$ is #P-hard

D (tuples not shown have $P=1$)

R

x_2	y_2	0

T	
Y	P
y_1	0.5
y_2	0.5

Hierarchical Queries

Fix Q ; $\text{at}(x)$ = set of atoms (=literals) containing the variable x

Definition Q is **hierarchical** if for all variables x, y :
 $\text{at}(x) \subseteq \text{at}(y)$ or $\text{at}(x) \supseteq \text{at}(y)$ or $\text{at}(x) \cap \text{at}(y) = \emptyset$

Hierarchical

$$Q = \forall x \forall y \forall z (S(x, y) \vee T(x, z))$$

Non-hierarchical

$$H_0 = \forall x \forall y (R(x) \vee S(x, y) \vee T(y))$$

The Small Dichotomy Theorem

[Dalvi&S.04]

Theorem Let Q be one clause, with no repeated symbols

- If Q is hierarchical, then $P_D(Q)$ is in PTIME.
- If Q is not hierarchical then $P_D(Q)$ is #P-hard.

Checking “ Q is hierarchical” is in AC^0 (expression complexity)

The Small Dichotomy Theorem

[Dalvi&S.04]

Theorem Let Q be one clause, with no repeated symbols

- If Q is hierarchical, then $P_D(Q)$ is in PTIME.
- If Q is not hierarchical then $P_D(Q)$ is #P-hard.

Checking “ Q is hierarchical” is in AC^0 (expression complexity)

[Dalvi,S.'12]

Fact: Any non-hierarchical Q in $\forall FO^{un}$ ($\exists FO^{un}$) is #P-hard

Next: consider only hierarchical queries in $\forall FO^{un}$ ($\exists FO^{un}$)

Clause with Repeated Symbols

$$Q_j = \forall x_1 \forall y_1 \forall x_2 \forall y_2 (S(x_1, y_1) \vee R(y_1) \vee S(x_2, y_2) \vee T(y_2))$$

Clause with Repeated Symbols

$$Q_j = \forall x_1 \forall y_1 \forall x_2 \forall y_2 (S(x_1, y_1) \vee R(y_1) \vee S(x_2, y_2) \vee T(y_2))$$

$$= [\underbrace{\forall x_1 \forall y_1 S(x_1, y_1) \vee R(y_1)}_{Q_1}] \vee [\underbrace{\forall x_2 \forall y_2 S(x_2, y_2) \vee T(y_2)}_{Q_2}]$$

Clause with Repeated Symbols

$$Q_J = \forall x_1 \forall y_1 \forall x_2 \forall y_2 (S(x_1, y_1) \vee R(y_1) \vee S(x_2, y_2) \vee T(y_2))$$

$$= [\forall x_1 \forall y_1 S(x_1, y_1) \vee R(y_1)] \vee [\forall x_2 \forall y_2 S(x_2, y_2) \vee T(y_2)]$$

Q_1

Q_2

$$P(Q_J) = P(Q_1) + P(Q_2) - P(Q_1 \wedge Q_2)$$

PTIME (have seen before)

Clause with Repeated Symbols

$$Q_J = \forall x_1 \forall y_1 \forall x_2 \forall y_2 (S(x_1, y_1) \vee R(y_1) \vee S(x_2, y_2) \vee T(y_2))$$

$$= [\forall x_1 \forall y_1 S(x_1, y_1) \vee R(y_1)] \vee [\forall x_2 \forall y_2 S(x_2, y_2) \vee T(y_2)]$$

Q_1

Q_2

$$P(Q_J) = P(Q_1) + P(Q_2) - P(Q_1 \wedge Q_2)$$

PTIME (have seen before)

$$y = y_1 = y_2$$

$$\begin{aligned} Q_1 \wedge Q_2 &= \forall y [(\forall x_1 S(x_1, y) \vee R(y)) \wedge (\forall x_2 S(x_2, y) \vee T(y))] \\ &= \forall y [\forall x S(x, y) \vee (R(y) \wedge T(y))] \end{aligned}$$

Clause with Repeated Symbols

$$Q_J = \forall x_1 \forall y_1 \forall x_2 \forall y_2 (S(x_1, y_1) \vee R(y_1) \vee S(x_2, y_2) \vee T(y_2))$$

$$= [\forall x_1 \forall y_1 S(x_1, y_1) \vee R(y_1)] \vee [\forall x_2 \forall y_2 S(x_2, y_2) \vee T(y_2)]$$

Q_1

Q_2

$$P(Q_J) = P(Q_1) + P(Q_2) - P(Q_1 \wedge Q_2)$$

PTIME (have seen before)

$$y = y_1 = y_2$$

$$\begin{aligned} Q_1 \wedge Q_2 &= \forall y [(\forall x_1 S(x_1, y) \vee R(y)) \wedge (\forall x_2 S(x_2, y) \vee T(y))] \\ &= \forall y [\forall x S(x, y) \vee (R(y) \wedge T(y))] \end{aligned}$$

$$P(Q_1 \wedge Q_2) = \prod_{B \in \text{Domain}} P[\forall x. S(x, B) \vee (R(B) \wedge T(B))] = \dots \text{etc}$$

$$\text{Runtime} = O(n^2).$$

Unliftable Queries H_k

$$H_0 = R(x) \vee S(x, y) \vee T(y)$$

$$H_1 = [R(x_0) \vee S(x_0, y_0)] \wedge [S(x_1, y_1) \vee T(y_1)]$$

Will drop \forall to reduce clutter

Every H_k , $k \geq 1$
is hierarchical

Unliftable Queries H_k

Will drop \forall to reduce clutter

$$H_0 = R(x) \vee S(x, y) \vee T(y)$$

$$H_1 = [R(x_0) \vee S(x_0, y_0)] \wedge [S(x_1, y_1) \vee T(y_1)]$$

$$H_2 = [R(x_0) \vee S_1(x_0, y_0)] \wedge [S_1(x_1, y_1) \vee S_2(x_1, y_1)] \vee [S_2(x_2, y_2) \vee T(y_2)]$$

Every H_k , $k \geq 1$
is hierarchical

Unliftable Queries H_k

Will drop \forall to reduce clutter

$$H_0 = R(x) \vee S(x, y) \vee T(y)$$

$$H_1 = [R(x_0) \vee S(x_0, y_0)] \wedge [S(x_1, y_1) \vee T(y_1)]$$

$$H_2 = [R(x_0) \vee S_1(x_0, y_0)] \wedge [S_1(x_1, y_1) \vee S_2(x_1, y_1)] \vee [S_2(x_2, y_2) \vee T(y_2)]$$

$$H_3 = [R(x_0) \vee S_1(x_0, y_0)] \wedge [S_1(x_1, y_1) \vee S_2(x_1, y_1)] \wedge [S_2(x_2, y_2) \vee S_3(x_2, y_2)] \wedge [S_3(x_3, y_3) \vee T(y_3)]$$

...

Every H_k , $k \geq 1$
is hierarchical

Unliftable Queries H_k

Will drop \forall to reduce clutter

$$H_0 = R(x) \vee S(x, y) \vee T(y)$$

$$H_1 = [R(x_0) \vee S(x_0, y_0)] \wedge [S(x_1, y_1) \vee T(y_1)]$$

$$H_2 = [R(x_0) \vee S_1(x_0, y_0)] \wedge [S_1(x_1, y_1) \vee S_2(x_1, y_1)] \vee [S_2(x_2, y_2) \vee T(y_2)]$$

$$H_3 = [R(x_0) \vee S_1(x_0, y_0)] \wedge [S_1(x_1, y_1) \vee S_2(x_1, y_1)] \wedge [S_2(x_2, y_2) \vee S_3(x_2, y_2)] \wedge [S_3(x_3, y_3) \vee T(y_3)]$$

...

Every H_k , $k \geq 1$
is hierarchical

Theorem. [Dalvi&S'12] Every query H_k is #P-hard

A Closer Look at H_k

If we drop any one clause \rightarrow in PTIME

$$H_3 = [R(x_0) \vee S_1(x_0, y_0)] \wedge [\cancel{S_1(x_1, y_1)} \vee \cancel{S_2(x_1, y_1)}] \wedge [S_2(x_2, y_2) \vee S_3(x_2, y_2)] \wedge [S_3(x_3, y_3) \vee T(y_3)]$$

A Closer Look at H_k

If we drop any one clause \rightarrow in PTIME

$$H_3 = [R(x_0) \vee S_1(x_0, y_0)] \wedge [S_1(x_1, y_1) \vee S_2(x_1, y_1)] \wedge [S_2(x_2, y_2) \vee S_3(x_2, y_2)] \wedge [S_3(x_3, y_3) \vee T(y_3)]$$

Independent join

The diagram illustrates an independent join between the first clause $[R(x_0) \vee S_1(x_0, y_0)]$ and the last clause $[S_3(x_3, y_3) \vee T(y_3)]$. Blue curly braces are placed under each of these two clauses. A long blue arrow points from the first brace to the second brace, indicating that these two clauses can be joined independently of the middle clauses.

If we replace $T(y_3)$ with $T(x_3)$ then in PTIME

$$[R(x_0) \wedge S_1(x_0, y_0)] \wedge [S_1(x_1, y_1) \vee S_2(x_1, y_1)] \wedge [S_2(x_2, y_2) \vee S_3(x_2, y_2)] \wedge [S_3(x_3, y_3) \vee T(x_3)]$$

Independent project on $x_0 = x_1 = x_2 = x_3$

The diagram shows an independent project on the variable x across all clauses. A blue arrow points from the text below to the variable x_3 in the last clause of the formula above. The text indicates that the variables $x_0, x_1, x_2,$ and x_3 are all the same variable, allowing for a single projection operation.

Cancellations

Q_W = a Boolean expression
over the clauses in H_3 Yet, in **PTIME**

$$\begin{aligned} Q_W = & [(R(x_0) \vee S_1(x_0, y_0)) \wedge (S_2(x_2, y_2) \vee S_3(x_2, y_2))] \vee /* Q_1 */ \\ & [(R(x_0) \vee S_1(x_0, y_0)) \wedge (S_3(x_3, y_3) \vee T(y_3))] \vee /* Q_2 */ \\ & [(S_1(x_1, y_1) \vee S_2(x_1, y_1)) \wedge (S_3(x_3, y_3) \vee T(y_3))] /* Q_3 */ \end{aligned}$$

Cancellations

Q_W = a Boolean expression
over the clauses in H_3 Yet, in PTIME

$$Q_W = [(R(x_0) \vee S_1(x_0, y_0)) \wedge (S_2(x_2, y_2) \vee S_3(x_2, y_2))] \vee /* Q_1 */ \\ [(R(x_0) \vee S_1(x_0, y_0)) \wedge (S_3(x_3, y_3) \vee T(y_3))] \vee /* Q_2 */ \\ [(S_1(x_1, y_1) \vee S_2(x_1, y_1)) \wedge (S_3(x_3, y_3) \vee T(y_3))] /* Q_3 */$$

$$P(Q_W) = P(Q_1) + P(Q_2) + P(Q_3) + \\ - P(Q_1 \wedge Q_2) - P(Q_2 \wedge Q_3) - P(Q_1 \wedge Q_3) \\ + P(Q_1 \wedge Q_2 \wedge Q_3)$$

Also = H_3

= H_3 (hard !)

Cancellations

Q_W = a Boolean expression
over the clauses in H_3 Yet, in **PTIME**

$$Q_W = [(R(x_0) \vee S_1(x_0, y_0)) \wedge (S_2(x_2, y_2) \vee S_3(x_2, y_2))] \vee /* Q_1 */ \\ [(R(x_0) \vee S_1(x_0, y_0)) \wedge (S_3(x_3, y_3) \vee T(y_3))] \vee /* Q_2 */ \\ [(S_1(x_1, y_1) \vee S_2(x_1, y_1)) \wedge (S_3(x_3, y_3) \vee T(y_3))] /* Q_3 */$$

$$P(Q_W) = P(Q_1) + P(Q_2) + P(Q_3) + \\ - P(Q_1 \wedge Q_2) - P(Q_2 \wedge Q_3) - P(Q_1 \wedge Q_3) \\ + P(Q_1 \wedge Q_2 \wedge Q_3)$$

= H_3 (hard !)

Also = H_3

Need to cancel terms to compute the query in **PTIME**

Using Mobius' function in the the lattice of Q 's minterms [Suciu'11]

The Big Dichotomy Theorem

Call Q liftable if the rules don't get stuck.

Dichotomy Theorem [Dalvi'12] Fix a $\forall\text{FO}^{\text{un}}$ query Q .

1. If Q is **liftable**, then $P(Q)$ is in PTIME
2. If Q is **not liftable**, then $P(Q)$ is #P-complete

Note Original formulation for UCQ;

Immediate extension to $\forall\text{FO}^{\text{un}}$ and for $\exists\text{FO}^{\text{un}}$

Discussion

- This answers Question 1: lifted inference rules are complete for $\forall\text{FO}^{\text{un}}$ (and for $\exists\text{FO}^{\text{un}}$)
- Notice: we did not use any symmetries!
- Beyond unate FO? Conjectures:
 - Rules+resolution* complete for CNF-FO
 - No complete set of rules for FO

* $Q = \forall x \forall y (R(x) \vee S(x,y)) \wedge \forall x \forall y (\neg S(x,y) \vee T(y))$
 $= \forall x \forall y (R(x) \vee S(x,y)) \wedge \forall x \forall y (\neg S(x,y) \vee T(y)) \wedge \forall x \forall y (R(x) \vee T(y))$
